

What Is Claimed Is:

1. A batch method for producing a high flash point pitch, comprising:  
maintaining the temperature of a batch of soft pitch at a substantially steady level,  
5 and introducing a sparging gas while maintaining the temperature of the batch at a  
substantially steady level.

2. The method of claim 1, wherein the soft pitch is produced by:  
(1) providing a batch of coal tar; and  
10 (2) heating the batch of coal tar until the batch of coal tar becomes a soft  
pitch.

3. The method of claim 2, wherein:  
in step (2), the batch of coal tar is heated until it obtains a softening point of  
15 between about 40°C to about 80°C.

4. The method of claim 3, wherein:  
in step (2), the batch of coal tar is heated until it obtains a softening point of  
between about 70°C to about 75°C.

20 5. The method of claim 2, wherein:

in step (2), the batch of coal tar is heated until it obtains a temperature of about 260° to about 270°C.

6. The method of claim 1, wherein the batch is maintained at a temperature of  
5 between about 255°C and about 275°C.
7. The method of claim 1, wherein the temperature is maintained at a substantially steady level with a temperature variance of no greater than about 10°C.
- 10 8. The method of claim 1, wherein the sparging gas is steam.
9. The method of claim 1, wherein the sparging gas is an inert gas.
10. The method of claim 9, wherein the sparging gas is steam, nitrogen, argon,  
15 helium, neon, or mixtures thereof.
11. The method of claim 1, wherein the temperature is maintained at a substantially steady level until the softening point of the batch reaches about 90°C.
- 20 12. The method of claim 11, wherein the temperature is maintained until the flash point of the batch is higher than about 270°C as measured by the Cleveland Open Cup test.

13. The method of claim 1, wherein the flash point in the batch increases at a rate faster than the rate the softening point increases.

5 14. The method of claim 12, wherein the flash point is from about 270°C to about 300°C.

15. A method of producing pitch for a carbon or graphite body, comprising:

(1) providing a batch of coal tar and providing a still;

10 (2) charging the batch into the still;

(3) heating the batch to a temperature to obtain a softening point of between about 70°C to 75°C; and

(4) maintaining said temperature at a steady level while introducing a sparging gas into the batch until the Mettler softening point reaches about 90°C, and the  
15 flash point of the batch is at least about 270°C as measured by the Cleveland Open Cup Test.

16. An impregnating or binder pitch for a carbon or graphite body having a softening point of about 84°C to about 96°C and a flash point as measured by the Cleveland Open

20 Cup test of higher than about 270°C.

17. The pitch of claim 16, wherein the softening point is about 88°C to about 92°C.

18. The pitch of claim 16, wherein the softening point is about 90°C.

19. The pitch of claim 16, wherein the flash point is from about 270°C to about  
5 300°C.

20. A pitch prepared according to the process of claim 1.

21. A pitch prepared according to the process of claim 2.

22. A pitch prepared according to the process of claim 6.

23. A pitch prepared according to the process of claim 11.

24. A pitch prepared according to the process of claim 12.
